Hiba Kakul · New Delhi, India · hibakakul@gmail.com · linkedin.com/in/hibakakul · hibakakul-hash.github.io/Conjunctions

I diagnose bottlenecks. I design platforms. I scale operations.

0-to-1 platform builder. Scaled operations for 250+ enterprise partners across India, West Asia and East Asia. Moved from reactive support to proactive product strategy through structured problem translation.

01_overview.md

A few quick answers

`--approach`

My approach: diagnose the constraint at platform level (fragmented data, no automation, missing visibility), design the architecture (what can be built?), then drive adoption (how do we make it stick?).

`--currently`

Currently building Filtrd's backend infrastructure and community architecture, while scaling Sab Link's artisan-to-market platform.

`--background`

Started as operations lead at Rivigo. Moved into product at Unicommerce, working from Consultant through Senior Consultant to Team Lead across 110+ enterprise accounts.

`--outside-work`

I write poetry, play basketball, and read a mix of fiction and non-fiction.

`--lets-talk`

Best way to reach me is email or LinkedIn. Always happy to talk platforms, constraints, and 0-to-1 builds.

03_experience.roadmap

Career roadmap

My path from operations into product.

NOW

Platform PM and Strategy, Sab Link

July 2026 – Present

Building a 0-to-1 platform connecting artisan-businesses from marginalized communities to market access and upskilling. Piloted to 5+ active makers with a 2-3x income uplift.

NOW

Platform Lead, Filtrd

2025 – Present · Part-time

Own backend infrastructure and community engagement architecture for a fintech platform focused on ethical investment education for women, built from market research into a 0-to-1 roadmap.

SHIPPED

Team Lead, Products Solutioning, Unicommerce

Mar 2023 – May 2024

Led product discovery and solution strategy for 100+ feature enhancements across quick commerce and returns automation, using feedback from 110+ enterprise accounts to prioritize. Led a team of 10 consultants and analysts, contributing to 95% CSAT.

SHIPPED

Senior Consultant, Product Solutioning, Unicommerce

Mar 2022 – Mar 2023

Ran technical deep dives (SQL, APIs, workflows) to find usability issues and define product and integration improvements. Translated 100+ customer use-cases into structured technical requirements.

SHIPPED

Consultant, Product Solutioning, Unicommerce

May 2021 – Mar 2022

Owned end-to-end delivery of multi-stakeholder integration projects, managing dependencies across product, engineering, QA, and customer teams.

SHIPPED

Service Manager, Rivigo

2020 – May 2021

Operations and analytics lead for Rivigo's top-tier Pan-India clients, including TATA Motors, Hilti India, and Firstcry. Redesigned service delivery workflows during COVID-19 while maintaining SLA continuity.

SHIPPED

Service Associate, Rivigo

Sep 2018 – 2020

Started here in operations, handling service delivery on the ground.

Selected product enablements

Unified Omni-Channel Data Integration

THE PROBLEM

Sugar Cosmetics operated across 100+ retail stores with siloed inventory and order data. Real-time visibility was impossible, leading to overselling, stockouts, and fragmented customer experiences.

CONSTRAINTS

- No engineering bandwidth. I designed the architecture, wrote the API playbook and technical spec, and guided Sugar's own dev team through the build.
- No slot on the native roadmap for a custom connector.
- The third-party WMS only supported webhooks for inventory updates.
- Shopify's API rate limits had to be managed carefully across 100+ stores.
- A tight deadline for a working solution across 100+ stores.

DESIGN AND DELIVERY

Assessed existing API capabilities across retail, e-commerce, and POS systems. Designed a webhook-based integration architecture for real-time inventory and order data sync. Coordinated technical requirements directly with the client's product team and validated the design through a staging pilot before go-live.

HOW IT WORKS

1. Shopify order arrives by webhook
2. Unicommerce checks nearest store stock
3. Routes to the store, or to the WMS if no stock
4. Shiprocket books the shipment
5. Tracking syncs back to Shopify

KEY DECISIONS

> **One inventory ledger**
>
> Unicommerce became the single source of truth for stock. Every system pushes stock changes to it first, and Shopify and the WMS read from it. That ended conflicting stock numbers across systems.

> **Built as a reusable playbook**
>
> Tenant URL, API keys, and store codes are variables, so other teams could reuse the same design for similar clients without starting over.

IMPACT

- → Delivered to production, improving inventory visibility and order synchronization phase-wise across 100+ stores
- → Freed ops teams for strategic work instead of firefighting
- → Playbook reused for later clients without re-architecting
- → Orders route to the nearest store with stock, which lowers shipping cost

Amazon B2B Order Integration

THE PROBLEM

Manual order reconciliation across 250+ enterprise brands' Amazon B2B channels created operational inefficiency and error risk. No reliable sync existed between Amazon and Unicommerce.

DISCOVERY

Ran structured interviews with brand ops teams and turned their pain points into user stories on Jira for four roles: brand ops, finance, warehouse, and business owners. Wrote the BRD and feature spec from that.

DESIGN AND DELIVERY

Identified the problem and built the business case. Engaged directly with Amazon's team to scope available integration options. Partnered with engineering and leadership through solution design, recommending a polling-based sync model chosen based on Amazon's webhook limitations at the time.

HOW IT WORKS

1. Brand gets a B2B order on Amazon Business
2. Unicommerce pulls it through the API
3. Order is flagged as B2B from the buyer type
4. Mapped to a Unicommerce order
5. Inventory reserved, warehouse picks
6. GST B2B invoice generated automatically
7. Shipped, invoice pushed to the brand's ERP

KEY DECISIONS

Polling over webhooks

Amazon's B2B webhook support was limited at the time, and B2B orders are not as time-critical as B2C. Polling kept the build simple and still met the SLA.

A separate B2B invoice template

Built a dedicated GST template with a buyer GSTIN field and a reverse-charge flag instead of reusing the B2C one, because compliance depended on it.

Pilot first

Ran a pilot with a small group of brands first, fixed edge cases in bulk orders and credit notes, then rolled out in phases.

IMPACT

- → Eliminated manual reconciliation across 250+ brands
- → Enabled seamless, scaled order processing
- → Reduced operational risk and human error
- → Freed finance and ops teams from routine reconciliation work
- → Set a reusable integration pattern for later B2B marketplace integrations

Ajio B2B2C GST Compliance Remediation

THE PROBLEM

Ajio's B2B2C model required two separate invoice chains. The existing integration mixed them, producing GST-invalid invoices. A client's CA flagged the mismatches, escalating to a compliance risk across 50+ brands.

ROOT CAUSE

BEFORE

Ajio invoices the end customer and the brand invoices Ajio, so every order has two invoice chains. The old integration built one invoice with the customer's address but Ajio's GSTIN as buyer, mixing B2B and B2C rules. A second customer invoice was also generated by mistake.

AFTER

Only the brand-to-Ajio B2B invoice is generated, with Ajio's GSTIN as buyer. Ajio issues its own invoice to the end customer, so the two chains stay separate.

DESIGN AND DELIVERY

Built the business case for remediation. Engaged Ajio's technical team directly to define the corrected invoicing approach. Partnered with engineering and business through the revamp, holding sign-off before rollout. Retrospectively corrected historical invoices with zero operational disruption.

KEY DECISIONS

> **Rebuild the classifier, don't patch**
>
> Instead of patching the old invoice template, built a classifier that reads the order type from the Ajio payload and routes it to the right template. Future changes to Ajio's model won't break invoicing.

> **Fix the past, not only the future**
>
> Worked with Ajio and brand finance teams to set the correction period, issued credit notes for the wrong invoices, and re-issued compliant ones. A one-time SQL batch script found every affected invoice.

> **Roll out by risk**
>
> Started with the brands at highest risk of GST escalation and validated invoice accuracy on pilot brands before rolling out to the rest.

IMPACT

- → Restored compliance across all affected brands, with zero violations post-launch
- → Retrospectively corrected historical invoices with zero disruption
- → Eliminated manual review, freed finance team
- → Scaled across 50+ brands without a compliance violation
- → Ajio formally approved the revamped integration as compliant

Filtrd: Ethical Investment Platform

THE PROBLEM

Women investors faced barriers: lack of accessible ethical investment education, limited Shariah-compliant options, and no aggregated financial data layer for third-party integration.

DESIGN AND DELIVERY

Translated market research (women's wealth gaps, Shariah-compliance constraints, investor sentiment) into a 0-to-1 roadmap. Built API layer enabling third-party financial data integration. Designed pricing model and community workshop framework connecting financial literacy to product adoption.

IMPACT

→ Designed backend infrastructure for scaled financial data integration

→ Built community engagement architecture connecting education to adoption

→ Established framework for workshop-led financial literacy

→ Creating infrastructure for ethical investing at scale

Sab Link: Artisan-to-Market Platform

THE PROBLEM

Artisans from marginalized communities had no unified platform for market access. Skill-sharing channels were fragmented. Artists had no aggregated visibility and faced barriers to direct-to-consumer sales.

DESIGN AND DELIVERY

Diagnosed the platform-level constraint: artisans needed both community visibility and market access. Designed a two-layer model combining skill-based workshops with a direct-to-consumer marketplace. Built the community layer first (monthly in-person skill-sharing workshops), then layered the digital platform enabling direct transactions and artist portfolios.

IMPACT

→ Piloted with 5+ active makers, connecting them to market access and visibility

→ Built skill-based entrepreneurship framework for scaling

→ Created community-led model reducing reliance on single founder

→ Established sustainable pathway for minority group economic growth
